**TITLE OF THE INVENTION**  
**INHIBITORS OF FARNESYL-PROTEIN TRANSFERASE**

**RELATED APPLICATION**

5           The present patent application is a continuation-in-part application of copending application Serial No. 07/902,618, filed June 23, 1992.

**BACKGROUND OF THE INVENTION**

10           The Ras gene is found activated in many human cancers, including colorectal carcinoma, exocrine pancreatic carcinoma, and myeloid leukemias. Biological and biochemical studies of Ras action indicate that Ras functions like a G-regulatory protein, since Ras must be localized in the plasma membrane and must bind with GTP in order  
15           to transform cells (Gibbs, J. et al., Microbiol. Rev. 53:171-286 (1989). Forms of Ras in cancer cells have mutations that distinguish the protein from Ras in normal cells.

          At least 3 post-translational modifications are involved with Ras membrane localization, and all 3 modifications occur at the C-  
20           terminus of Ras. The Ras C-terminus contains a sequence motif termed a "CAAX" or "Cys-Aaa<sup>1</sup>-Aaa<sup>2</sup>-Xaa" box (Aaa is an aliphatic amino acid, the Xaa is any amino acid) (Willumsen et al., Nature 310:583-586 (1984)). Other proteins having this motif include the Ras-related GTP-binding proteins such as Rho, fungal mating factors, the nuclear lamins,  
25           and the gamma subunit of transducin.

          Farnesylation of Ras by the isoprenoid farnesyl pyrophosphate (FPP) occurs in vivo on Cys to form a thioether linkage (Hancock et al., Cell 57:1167 (1989); Casey et al., Proc. Natl. Acad. Sci. USA 86:8323 (1989)). In addition, Ha-Ras and N-Ras are palmitoylated  
30           via formation of a thioester on a Cys residue near a C-terminal Cys farnesyl acceptor (Gutierrez et al., EMBO J. 8:1093-1098 (1989); Hancock et al., Cell 57: 1167-1177 (1989)). Ki-Ras lacks the palmitate acceptor Cys. The last 3 amino acids at the Ras C-terminal end are removed proteolytically, and methyl esterification occurs at the new C-

- 2 -

terminus (Hancock *et al.*, *ibid*). Fungal mating factor and mammalian nuclear lamins undergo identical modification steps (Anderegg *et al.*, *J. Biol. Chem.* 263:18236 (1988); Farnsworth *et al.*, *J. Biol. Chem.* 264:20422 (1989)).

5 Inhibition of Ras farnesylation *in vivo* has been demonstrated with lovastatin (Merck & Co., Rahway, NJ) and compactin (Hancock *et al.*, *ibid*; Casey *et al.*, *ibid*; Schafer *et al.*, *Science* 245:379 (1989)). These drugs inhibit HMG-CoA reductase, the rate limiting enzyme for the production of polyisoprenoids and the  
10 farnesyl pyrophosphate precursor. It has been shown that a farnesyl-protein transferase using farnesyl pyrophosphate as a precursor is responsible for Ras farnesylation. (Reiss *et al.*, *Cell*, 62: 81-88 (1990); Schaber *et al.*, *J. Biol. Chem.*, 265:14701-14704 (1990); Schafer *et al.*, *Science*, 249: 1133-1139 (1990); Manne *et al.*, *Proc. Natl. Acad. Sci. USA*, 87: 7541-7545 (1990)).

15 Inhibition of farnesyl-protein transferase and, thereby, of farnesylation of the Ras protein, blocks the ability of Ras to transform normal cells to cancer cells. The compounds of the invention inhibit Ras farnesylation and, thereby, generate soluble Ras which, as indicated  
20 *infra*, can act as a dominant negative inhibitor of Ras function. While soluble Ras in cancer cells can become a dominant negative inhibitor, soluble Ras in normal cells would not be an inhibitor.

A cytosol-localized (no Cys-Aaa<sup>1</sup>-Aaa<sup>2</sup>-Xaa box membrane domain present) and activated (impaired GTPase activity, staying bound to GTP) form of Ras acts as a dominant negative Ras inhibitor of  
25 membrane-bound Ras function (Gibbs *et al.*, *Proc. Natl. Acad. Sci. USA* 86:6630-6634(1989)). Cytosollocalized forms of Ras with normal GTPase activity do not act as inhibitors. Gibbs *et al.*, *ibid*, showed this effect in *Xenopus* oocytes and in mammalian cells.

30 Administration of compounds of the invention to block Ras farnesylation not only decreases the amount of Ras in the membrane but also generates a cytosolic pool of Ras. In tumor cells having activated Ras, the cytosolic pool acts as another antagonist of membrane-bound Ras function. In normal cells having normal Ras, the cytosolic pool of

- 3 -

Ras does not act as an antagonist. In the absence of complete inhibition of farnesylation, other farnesylated proteins are able to continue with their functions.

Farnesyl-protein transferase activity may be reduced or completely inhibited by adjusting the compound dose. Reduction of farnesyl-protein transferase enzyme activity by adjusting the compound dose would be useful for avoiding possible undesirable side effects resulting from interference with other metabolic processes which utilize the enzyme.

These compounds and their analogs are inhibitors of farnesyl-protein transferase. Farnesyl-protein transferase utilizes farnesyl pyrophosphate to covalently modify the Cys thiol group of the Ras CAAX box with a farnesyl group. Inhibition of farnesyl pyrophosphate biosynthesis by inhibiting HMG-CoA reductase blocks Ras membrane localization *in vivo* and inhibits Ras function. Inhibition of farnesyl-protein transferase is more specific and is attended by fewer side effects than is the case for a general inhibitor of isoprene biosynthesis.

Previously, it has been demonstrated that tetrapeptides containing cysteine as an amino terminal residue with the CAAX sequence inhibit Ras farnesylation (Schaber *et al.*, *ibid*; Reiss *et al.*, *ibid*; Reiss *et al.*, *PNAS*, 88:732-736 (1991)). Such inhibitors may inhibit while serving as alternate substrates for the Ras farnesyl-transferase enzyme, or may be purely competitive inhibitors (U.S. Patent 5,141,851, University of Texas).

Recently, it has been demonstrated that certain inhibitors of farnesyl-protein transferase selectively block the processing of Ras oncoprotein intracellularly (N.E. Kohl *et al.* *Science*, 260:1934-1937 (1993) and G.L. James *et al.* *Science*, 260:1937-1942 (1993)).

It is, therefore, an object of this invention to develop non-peptide compounds which will inhibit farnesyl-protein transferase and the growth of cancer cells. It is a further object of this invention to develop chemotherapeutic compositions containing the compounds of

- 4 -

this invention, and methods for producing the compounds of this invention.

The pharmaceutically acceptable salts of the compounds of  
25 this invention can be synthesized from the compounds of this invention

Generally, the salts are prepared by reacting the free base with  
stoichiometric amounts or with an excess of the desired salt-forming  
inorganic or organic acid in a suitable solvent or various combinations  
30 of solvents.

Reactions used to generate the compounds of this invention  
are prepared by employing reactions as shown in the Reaction Schemes  
1-9, in addition to other standard manipulations such as ester hydrolysis,

- 29 -

cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. Substituents R<sup>a</sup> and R<sup>b</sup>, as shown in the Schemes, represent the substituents R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, and R<sup>5</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting.

5           These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Reaction Schemes.

10   Synopsis of reaction Schemes 1-9:

          The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures, for the most part. In Scheme 1, for example, the synthesis of 2-alkyl substituted piperazines is outlined, and is essentially that described by J. S. Kiely and S. R. Priebe in *Organic Preparations and Proceedings Int.*,  
15   1990, 22, 761-768. Boc-protected amino acids I, available commercially or by procedures known to those skilled in the art, can be coupled to N-benzyl amino acid esters using a variety of dehydrating agents such as DCC (dicyclohexycarbodiimide) or EDC-HCl (1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride) in a solvent such  
20   as methylene chloride, chloroform, dichloroethane, or in dimethylformamide. The product II is then deprotected with acid, for example hydrogen chloride in chloroform or ethyl acetate, or trifluoroacetic acid in methylene chloride, and cyclized under weakly  
25   basic conditions to give the diketopiperazine III. Reduction of III with lithium aluminum hydride in refluxing ether gives the piperazine IV, which is protected as the Boc derivative V. The N-benzyl group can be cleaved under standard conditions of hydrogenation, e.g., 10% palladium on carbon at 60 psi hydrogen on a Parr apparatus for  
30   24-48 h. The product VI can be treated with an acid chloride, or a carboxylic acid under standard dehydrating conditions to furnish the carboxamides VII; a final acid deprotection as previously described gives the intermediate VIII. This is reductively alkylated with the

- 30 -

protected cysteinal XI, which is prepared from the appropriately protected cysteine derivative IX according to the procedure described by O. P. Goel, U. Krolls, M. Stier and S. Kesten in *Organic Syntheses*, 1988, 67, 69-75. The reductive alkylation can be accomplished at pH 5-7 with a variety of reducing agents, such as sodium

5 triacetoxyborohydride or sodium cyanoborohydride in a solvent such as dichloroethane, methanol or dimethylformamide. The product XII can be deprotected to give the final compounds XIII with trifluoroacetic acid in methylene chloride in the presence of triethylsilane. The final product XIII is isolated in the salt form, for example, as a

10 trifluoroacetate, hydrochloride or acetate salt, among others.

Alternatively, the protected piperazine intermediate V can be deprotected under acidic conditions as previously described to give IV; or IV can be used directly from Scheme 1 and reductively alkylated with the aldehyde XI as previously described to give compound XIV.

15 The benzyl group can be removed from XIV with chloroethyl chloroformate under buffered conditions, followed by methanol to give compound XV. Elaboration as previously described results in the desired compounds XIII.

The disulfide of XIII can be prepared according to Scheme 20 4, wherein an alcoholic solution of a salt of XIII is treated with iodine.

Depending on the identity of the amino acid I, various side chains can be incorporated. For example when I is the Boc-protected  $\beta$ -benzyl ester of aspartic acid, the intermediate diketopiperazine XVII where  $n=1$  and  $R=\text{benzyl}$  is obtained, as shown in Scheme 5.

25 Subsequent lithium aluminum hydride reduction reduces the ester to the alcohol XVIII, which can then be reacted with a variety of alkylating agents such as an alkyl iodide, under basic conditions, for example, sodium hydride in dimethylformamide or tetrahydrofuran. The resulting ether XIX can then be carried on to final products as described

30 in Scheme 2.

N-Aryl piperazines can be prepared as described in Scheme 6. An aryl amine XX is reacted with *bis* -chloroethyl amine hydrochloride in refluxing *n* -butanol to furnish compounds XXI. This

- 31 -

is reductively alkylated with the aldehyde XI, and the product subjected to a final deprotection to give compounds XXIII.

Piperazin-5-ones can be prepared as shown in Scheme 7. Reductive amination of Boc-protected amino aldehydes XXV (prepared from I as described previously) gives rise to XXVI. This is then reacted  
5 with bromoacetyl bromide under Schotten-Baumann conditions; ring closure is effected with a base such as sodium hydride in a polar aprotic solvent such as dimethylformamide to give XXVII. The carbamate protecting group is removed under acidic conditions such as  
10 trifluoroacetic acid in methylene chloride, or hydrogen chloride gas in methanol or ethyl acetate, and the product reductively alkylated with the protected cysteinal XI as previously described to give, after final deprotection, the desired compounds.

The isomeric piperazin-3-ones can be prepared as described in Scheme 8. The imine formed from arylcarboxamides XXX and 2-  
15 aminoglycinal diethyl acetal can be reduced under a variety of conditions, including sodium triacetoxyborohydride in dichloroethane to give the amine XXXI. Amino acids I can be coupled to amines XXXI under standard conditions, and the resulting amide XXXII when treated with aqueous acid in tetrahydrofuran cyclized to the unsaturated XXXII.  
20 Catalytic hydrogenation under standard conditions gives the requisite intermediate XXXIV, which is elaborated to final products as described in Scheme 7.

Access to alternatively substituted piperazines is described in Scheme 9. Following deprotection with trifluoroacetic acid, the N-  
25 benzyl piperazine V can be acylated with an aryl carboxylic acid. The resulting N-benzyl aryl carboxamide XXXVI can be hydrogenated in the presence of a catalyst to give the piperazine carboxamide XXXVII. Reductive alkylation of XXXVII with the protected cysteine aldehyde XI gives the fully elaborated XXXVIII, which can be deprotected to  
30 yield the desired isomer XXXIX.

The compounds of this invention inhibit farnesyl-protein transferase and the farnesylation of the oncogene protein Ras. These compounds are useful as pharmaceutical agents for mammals, especially for humans. These compounds may be administered to patients for use in the treatment of cancer. Examples of the type of cancer which may be treated with the compounds of this invention include, but are not limited to, colorectal carcinoma, exocrine pancreatic carcinoma, and myeloid leukemias.

The compounds of this invention may be administered to mammals, preferably humans, either alone or, preferably, in combination with pharmaceutically acceptable carriers or diluents, optionally with known adjuvants, such as alum, in a pharmaceutical composition, according to standard pharmaceutical practice. The compounds can be administered orally or parenterally, including the intravenous, intramuscular, intraperitoneal, subcutaneous, rectal and topical routes of administration.

For oral use of a chemotherapeutic compound according to this invention, the selected compound may be administered, for example, in the form of tablets or capsules, or as an aqueous solution or suspension. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch, and lubricating agents, such as magnesium stearate, are commonly added. For oral administration in capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring agents may be added. For intramuscular, intraperitoneal, subcutaneous and intravenous use, sterile solutions of the active ingredient are usually prepared, and the pH of the solutions should be suitably adjusted and buffered. For intravenous use, the total concentration of solutes should be controlled in order to render the preparation isotonic.

Administration occurs in an amount between about 0.1 mg/kg of body weight to about 60 mg/kg of body weight per day, preferably of between 0.5 mg/kg of body weight to about 40 mg/kg of body weight per day.

### EXAMPLES

Examples provided are intended to assist in a further understanding of the invention. Particular materials employed, species and conditions are intended to be further illustrative of the invention and not limitative of the reasonable scope thereof. Purification by HPLC was accomplished with a 40 X 100 mm Waters PrepPak® reverse phase HPLC column (Delta-Pak™ C18 15 µm, 100 Å). Gradient elution employed 0.1% trifluoroacetic acid in water (Solvent A) and 0.1% trifluoroacetic acid in acetonitrile (Solvent B). Chloride salts were obtained by passing an aqueous solution of the trifluoroacetic acid salt through a Biorad AG® 3X4 ion exchange resin column (100-200 mesh, C1-form). Purification by HPLC was utilized for each of the Examples 1-22 as set forth below.

The title compound was synthesized essentially according to the procedure described by O. P. Goel, U. Krolls, M. Stier, and S. Kesten in Organic Syntheses, 1988, 67, 69-75. Thus N,O-dimethylhydroxylamine hydrochloride (1.05 g, 10.82 mmol) and N-methylmorpholine (1.22 mL, 11.14 mmol) were stirred in dichloromethane (6 mL) under nitrogen at 0°C for 30 min. In a separate flask, 2(R)-tert-butoxycarbonylamino-3-triphenylmethyl-thiopropionic acid (5.02 g, 10.82 mmol) in tetrahydrofuran (11.5 mL, dry) and methylene chloride

- 46 -

(45 mL) were cooled to  $-20^{\circ}\text{C}$ , and N-methylmorpholine (1.22 mL, 11.14 mmol) and isopropylchloroformate (10.82 mL of 1M solution in toluene) were added *via* syringe, maintaining the temperature less than  $-15^{\circ}\text{C}$ . The reaction was stirred at  $-30^{\circ}\text{C}$ , and the suspension of N,O-dimethylhydroxylamine hydrochloride and N-methylmorpholine in methylene chloride added all at once. The cooling bath was removed and the reaction allowed to warm to room temperature over 4 h. The reaction was cooled to  $0^{\circ}\text{C}$  and quickly washed with two portions of 0.2 N hydrochloric acid, two portions of 0.5 N sodium hydroxide, and saturated sodium chloride solution. The organic phase was dried over magnesium sulfate, filtered and reduced *in vacuo* to obtain the title compound as a clear gum, 5.50 g. NMR (300 MHz, DMSO- $d_6$ )  $\delta$  7.30 (15H, m), 4.43 (1H, br s), 3.56 (3H, s), 2.99 (3H, s), 2.30 (2H, m), 1.36 (9H, s).

Step C:     2(R)-*tert*-Butoxycarbonylamino-3-triphenylmethylthiopropional

The title compound was synthesized essentially according to the procedure described by O. P. Goel, U. Krolls, M. Stier, and S. Kesten in Organic Syntheses, 1988, 67, 69-75. Thus lithium aluminum hydride (0.451 g, 11.90 mmol) and diethyl ether (40 mL) were stirred at  $20^{\circ}\text{C}$  under nitrogen for 1 h, then cooled to  $-45^{\circ}\text{C}$ . N-Methoxy-N-methyl 2(R)-*tert*-butoxycarbonylamino-3-triphenylmethylthiopropionamide (5.50 g, 10.82 mmol) in diethyl ether (20 mL) was added in a steady stream, maintaining the temperature less than  $-35^{\circ}\text{C}$ . The cooling bath was removed and the reaction warmed to  $5^{\circ}\text{C}$ , then cooled to  $-35^{\circ}\text{C}$ . A solution of potassium hydrogen sulfate (2.94 g, 21.64 mmol) in water (50 mL) was added slowly, maintaining the temperature less than  $0^{\circ}\text{C}$ . The reaction was warmed to  $20^{\circ}\text{C}$  over 1 h, and filtered through Celite. The filtrate was washed with 10% citric acid, saturated sodium chloride solution, and dried over magnesium sulfate. After filtration, the solvents were removed *in vacuo* and the title compound obtained as a foam (4.80 g).

- 47 -

**Step D:**     1-(2(R)-*tert* -Butoxycarbonylamino-3-triphenylmethyl-thiopropyl)-4-(2,3-dimethylbenzoyl)piperazine

The product from step A (0.480 g, 0.860 mmol) was dissolved in methylene chloride (4 mL) and trifluoroacetic acid was added (2 mL). The reaction was stirred for 30 min. at 20°C, then evaporated to dryness. The crude trifluoroacetate salt was taken up in dimethylformamide and the pH adjusted to 6 by the addition of triethylamine. To this solution was added sodium triacetoxyborohydride (0.331 g, 1.56 mmol), and crushed molecular sieves (0.5 g), and the reaction cooled to 0°C under nitrogen. 2(R)-N-*tert* -butoxycarbonylamino-3-triphenylmethylthiopropional (0.350 g, 0.782 mmol) in dimethylformamide was added slowly dropwise. The reaction was stirred at 20°C under nitrogen for 2 h. The dimethylformamide was removed *in vacuo* and the residue partitioned between saturated sodium bicarbonate and ethyl acetate. The organic phase was washed with saturated sodium chloride and dried over magnesium sulfate. Filtration and evaporation gave the title compound as a white foam. NMR (CDCl<sub>3</sub>, 300 MHz)  $\delta$  7.0-7.6 (18H, m), 5.60 (1H, br s), 4.4-4.9 (1H, m), 2.1-3.9 (12H, m), 2.25 (3H, s), 2.15 (3H, br s), 1.40 (9H, s).

**Step E:**     1-(2(R)-Amino-3-mercaptopropyl)-4-(2,3-dimethylbenzoyl)piperazine dihydrochloride

The product from step D and triethylsilane (0.54 mL, 3.4 mmol) were dissolved in methylene chloride (6 mL). To this solution was added trifluoroacetic acid (3 mL) and the reaction stirred at 20°C for 30 min. The reaction was evaporated to dryness and partitioned between hexane and water. The aqueous phase was injected onto a 40 X 100 mm Waters PrepPak<sup>®</sup> reverse phase HPLC column (Delta-Pak<sup>™</sup> C18 15  $\mu$ m, 100 Å), and pure product isolated by gradient elution using 100% Solvent A (0.1% trifluoroacetic acid in water) to 50% Solvent A/50% Solvent B (0.1 % trifluoroacetic acid in acetonitrile) over 50 min at a flow rate of 40 mL/min. Combined fractions were evaporated, dissolved in water and passed through a Biorad AG<sup>®</sup> 3X4 ion exchange

- 48 -

### Step A:     1-Benzyl-3(S)-methylpiperazine-2,5-dione

The title compound was prepared according to the procedure described by John S. Kiely and Stephen R. Priebe in *Organic Preparations and Procedures Int.*, 22 (6), 761-768 (1990). Thus 100 mL of a stock solution of dicyclohexylcarbodiimide in methylene chloride (0.5 M) was added to methylene chloride (250 mL). This solution was cooled to 0°C under nitrogen and Boc-L-alanine (9.46 g, 50.00 mmol) was added. The resulting slurry was stirred for 5 min, and then ethyl N-benzylglycinate (9.37 mL, 50.00 mmol) was added. 20 The reaction was stirred for 2 h at 0°C, then at 20°C overnight. The precipitate was removed by filtration, and hydrogen chloride gas bubbled through the methylene chloride solution for 2-4 h, until the reaction was shown to be complete by tlc. The solvent was removed *in vacuo*, and the residue partitioned between ethyl acetate (150 mL) and 25 saturated sodium bicarbonate solution (42 mL). The organic phase was washed with saturated sodium chloride, dried over magnesium sulfate, filtered and evaporated. The crude product was recrystallized from toluene to give the title compound as white crystals (5.88 g). NMR (300 MHz, CDCl<sub>3</sub>) δ 7.30-7.38 (3H, m), 7.22-7.30 (2H, m), 6.94 (1H, br s), 30 4.59 (2H, s), 4.14 (1H, q, J=7 Hz), 3.84 (2H, s), 1.52 (3H, d, J=7 Hz).

### Step B:     4-Benzyl-1-tert-butoxycarbonyl-2(S)-methylpiperazine

The product from Step A (5.88 g, 27.00 mmol) was dissolved in THF (200 mL) and cooled under nitrogen to 0°C with

- 49 -

mechanical stirring. Lithium aluminum hydride (3.69 g, 0.097 mol) was added slowly. The reaction was refluxed for 18 h, cooled to 0°C, and quenched by the sequential slow addition of 5 mL H<sub>2</sub>O, 5 mL 10% sodium hydroxide solution and 5 mL H<sub>2</sub>O. The reaction was stirred for 30 min and filtered. The solvent was removed *in vacuo*, the crude product taken up in methylene chloride and dried over magnesium sulfate. The drying agent was removed by filtration, and the filtrate treated with di-*tert*-butyl dicarbonate (6.03 g, 27.6 mmol). After 2 h at 20°C, saturated sodium bicarbonate was added. The layers were separated, and the organic phase washed with saturated sodium chloride solution, then dried over magnesium sulfate. Filtration and evaporation gave the crude product which was purified by column chromatography on silica gel, eluting with 5% ethyl acetate in hexane. The title compound was obtained as a foam (5.28 g). NMR (300 MHz, CDCl<sub>3</sub>) δ 7.25 (5H, m), 4.18 (1H, br s), 3.80 (1H, d, J=12 Hz), 3.46 (2H, AB q, J=14 Hz), 3.11 (1H, dt, J=4, 12 Hz), 2.75 (1H, d, J=10 Hz), 2.58 (1H, d, J=10 Hz), 2.12 (1H, dd, J=4, 12 Hz), 2.00 (1H, dt, J=4, 12 Hz), 1.45 (9H, s), 1.23 (3H, d, J=7 Hz).

**Step C:** 1-*tert*-Butoxycarbonyl-2(S)-methylpiperazine

The product from Step B (5.28 g, 18.2 mmol) was dissolved in methanol (75 mL) in a Parr bottle, and the vessel purged with argon. To this was added 10 % palladium on carbon (1.0 g) and the reaction hydrogenated under 60 psi hydrogen for 24 h. The catalyst was removed by filtration through Celite, and the filtrate evaporated *in vacuo* to give the title compound as an oil (3.33 g). NMR (300 MHz, CDCl<sub>3</sub>) δ 4.15 (1H, m), 3.77 (1H, d, J=12 Hz), 2.85-3.06 (3H, m), 2.75 (1H, d, J=12 Hz), 2.64 (1H, dt, J=4, 12 Hz), 2.13 (1H, s), 1.45 (9H, s), 1.40 (3H, d, J=7 Hz).

**Step D:** 1-*tert*-Butoxycarbonyl-4-(2,3-dimethylbenzoyl)-2(S)-methylpiperazine

The product from Step C (1.00 g, 5.00 mmol) was converted to the title compound according to the procedure described in

- 50 -

Example 1, Step A using 2,3-dimethylbenzoic acid (0.750 g, 5.00 mmol), HOBT (0.765 g, 5.00 mmol), EDC • HCl (0.958 g, 5.00 mmol) and triethylamine to adjust the pH to 7. The title compound was obtained as a pale yellow solid (1.64 g).

5     Step E:     1-[2(R)-N-*tert*-Butoxycarbonylamino-3-triphenylmethyl-thiopropyl]-4-(2,3-dimethylbenzoyl)-2(S)-methyl-piperazine

                  The title compound was obtained from the product of Step D (0.390 g, 1.17 mmol) according to the procedure described in  
10     Example 1, Step D. Thus, 1-*tert*-butoxycarbonyl-4-(2,3-dimethylbenzoyl)-2(S)-methylpiperazine (0.390 g, 1.17 mmol) was first treated with trifluoroacetic acid (3 mL) in methylene chloride (6 mL) for 30 min. The reaction was evaporated to dryness, and the crude product reacted with sodium triacetoxyborohydride (0.331 g, 1.56 mmol) and  
15     2(R)-N-*tert*-butoxycarbonylamino-3-triphenylmethylthiopropional (0.350 g, 0.782 mmol) in the presence of crushed molecular sieves (0.5 g) in DMF at pH 6 and 0-20°C overnight. The title compound was obtained as a foam (0.370 g).

20     Step F:     1-[2(R)-Amino-3-mercaptopropyl]-4-(2,3-dimethylbenzoyl)-2(S)-methylpiperazine dihydrochloride

                  The product from Step E (0.370 g, 0.55 mmol) was converted to the title compound according to the procedure described for Step E, Example 1 using triethylsilane (0.350 mL, 2.20 mmol) and  
25     trifluoroacetic acid (4.5 mL) in methylene chloride (9 mL). Purification by preparative HPLC (gradient elution: 100% Solvent A to 50% Solvent A/50% Solvent B, 50 min) and ion exchange provided the title compound as a white powder (0.140 g).

EXAMPLE 33

30

In vivo ras farnesylation assay

The cell line used in this assay was the v-ras line, which expressed viral Ha-ras p21. The assay was performed essentially as

- 108 -

described in DeClue, J.E. *et. al.*, Cancer Research 51, 712-717, (1991). Cells in 10 cm dishes at 50-75% confluency were treated with the test compound (final concentration of solvent, methanol or dimethyl sulfoxide, was 0.1%). After 4 hours at 37°C, the cells were labelled in 3 ml methionine-free DMEM supplemented with 10% regular DMEM, 2% fetal bovine serum and 400 µCi [<sup>35</sup>S]methionine (1000 Ci/mmol). After an additional 20 hours, the cells were lysed in 1 ml lysis buffer (1% NP40/20 mM HEPES, pH 7.5/5 mM MgCl<sub>2</sub>/1mM DTT/10 µg/ml aprotinen/2 µg/ml leupeptin/2 µg/ml antipain/0.5 mM PMSF) and the lysates cleared by centrifugation at 100,000 x g for 45 min. Aliquots of lysates containing equal numbers of acid-precipitable counts were bought to 1 ml with IP buffer (lysis buffer lacking DTT) and immunoprecipitated with the ras-specific monoclonal antibody Y13-259 (Furth, M.E. *et. al.*, J. Virol. 43, 294-304, (1982)). Following a 2 hour antibody incubation at 4°C, 200 µl of a 25% suspension of protein A-Sepharose coated with rabbit anti rat IgG was added for 45 min. The immunoprecipitates were washed four times with IP buffer (20 nM HEPES, pH 7.5/1 mM EDTA/ 1% Triton X-100/0.5% deoxycholate/0.1%/SDS/0.1 M NaCl) boiled in SDS-PAGE sample buffer and loaded on 13% acrylamide gels. When the dye front reached the bottom, the gel was fixed, soaked in Enlightening, dried and autoradiographed. The intensities of the bands corresponding to farnesylated and nonfarnesylated ras proteins were compared to determine the percent inhibition of farnesyl transfer to protein. Data for representative test compounds are tabulated in Table 2.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 94/05634

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 17-24 are directed to a method of treatment of the human body, the search has been carried out and based on the attributed effects of the compounds.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:
